

New at GeBE:

Cutter for a wide range of materials - even for linerless paper

Germering, 26.09.2017. GeBE Elektronik und Feinwerktechnik GmbH in Germering, Germany, has expanded its product range to

include special cutters for OEM. These are able to cut paper, foil or shrink tubing - up to cardboard thickness. And rotary cutters are also available. GeBE cutters are always customized to meet client specifications.

A distinctive feature of the new cutter range is the specially treated Linerless Cutter. Direct contact with the adhesive spread of self-adhesive papers without protective liner, so-called linerless papers, presents a challenge for the paper guide as well as for the cutter blades. Yet in practice these papers offer advantages, which accounts for the increasing demand. A rewinder for the carrier material is not needed and disposal of the carrier as special waste is thus not necessary.

The Linerless Cutter from GeBE is prepared in such a way that, despite contact with the adhesive, a smooth paper guide is ensured. And the cutting edges remain largely free of adhesive residue due to a special substance integrated into the base material.

Depending on the paper specification, the manufacturer guarantees some 500,000 to 1,500,000 cuts. GeBE adapts every OEM cutter according to the customer's requirements and has more than 30 years of experience with individual OEM adjustments.

About Us:

For several decades GeBE Elektronik und Feinwerktechnik GmbH has been a well-known partner for input and output devices for micro-processor systems in the industry. The GeBE product offering includes thermal printers, HMI devices and keyboards of various designs. Through a proven DIN EN 9001 certified quality system and many years of manufacturing experience GeBE has built a large OEM customer base - especially in the field of small and medium volume series. GeBE manufactures sub-assemblies as well as complete devices. GeBE implements customer-specific solutions simply, quickly and cost effectively, starting with small order volume series.
